

Treatment

Using the Sciton powerful Prolipo Plus system, two laser wavelengths are blended together to better target the sweat glands. This energy is directed down a tiny (1 mm) fiber optic through only two 1.5 mm circular incisions (minimal scarring).

Alternative Treatments

- Treatment of the cause, if possible.
- General cleaning of the body and frequent bathing.
- Changing of socks and underwear repeatedly and using lightweight clothes.
- Avoid excess heat and humidity.
- Avoid certain types of food such as excess proteins, garlic, and spices.
- Aeration of the area.
- Apply dusting powder to severe areas of hyperhidrosis prior to dressing.
- Soaks for the feet such as potassium permanganate 1: 2000 or formaldehyde solution.
- Over the counter clinical strength deodorants (Certain Dry) or prescription deodorants (Drysol).
- Antibacterial antiseptic soap (Cidal soap).
- Botox injections every 3 to 6 months.
- Oral anticholinergic medications, such as Ditropan XL, Robinul Forte or Symax.

Benefits of SDLA®

- Decreases severity of excessive sweating.
- Decreases foul odor.

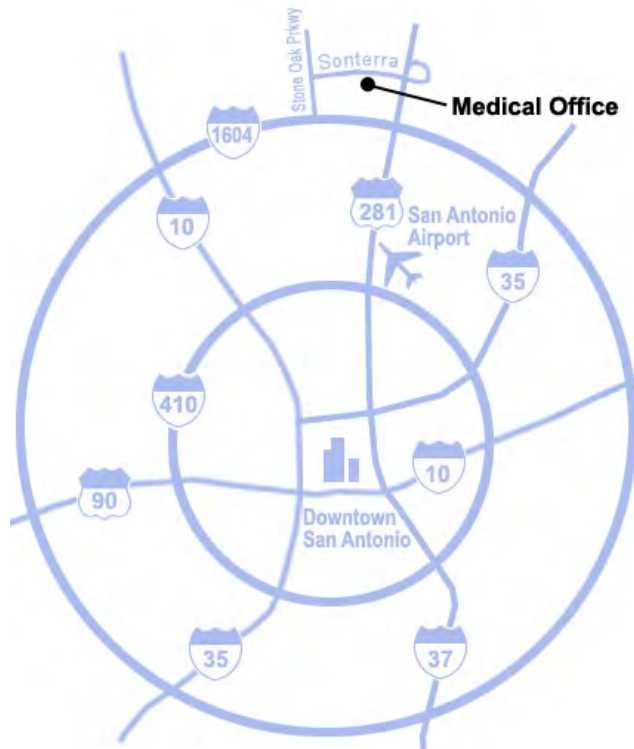

Advantages of SDLA®

- Local anesthesia.
- Out-patient office procedure.
- Low risk, minimal side effects.
- Typically only one single treatment required vs. Repeat Botox injections every 3 to 6 months.
- Fast recovery time.

Risks / Complications (Rare Occurance)

- Reduced hair.
- Numbness of skin.
- Blistering.
- Mild bruising.
- Shoulder movement limitation.
- Brachial nerve injury.

SDLA® Subdermal Laser Ablation

SDLA®

Subdermal Laser Ablation for Overactive Sweat Glands.

Effective Treatment for:

- Excessive under-arm sweating / malodor.
- Excessive sweating on the chest, under breasts, abdomen, back, thighs, or legs.
- Compensatory sweating after a sympathectomy.
- Two tiny 1.5 mm incisions.
- Local anesthesia.
- In-Office procedure.
- Low risk, minimal side effects.
- Typically one single treatment vs. repeat Botox injections.
- Fast recovery time.

There Are Options

Introduction

Hyperhidrosis, or excessive sweating, can be a stressful condition that may lead to tremendous social embarrassment. Traditional conservative treatments, such as antiperspirants, medications and Botox, are only temporarily effective. This has led Dr. Nielson to provide a new minimally invasive surgical treatment that is provided in our San Antonio office.

Other surgical treatment options such as gland excision, curettage, liposuction with or without ultrasound, have longer recovery times with more bruising that most patients would consider to be unacceptable for the treatment of sweating and odor. However, a new technique is now being offered by Dr. Nielson called Sub-Dermal Laser Ablation (SDLA®).

Dr. Nielson's SDLA® technique uses two laser wavelengths simultaneously (blending). This blending of wavelengths provides for longer term improvement. Control of excessive sweating of the underarms, chest, abdomen, back, legs or thighs is possible with this technique. SDLA® may be the treatment you have dreamed about if you experience hyperhidrosis that soaks through your clothing leaving embarrassing sweat stains. SDLA® can significantly decrease your excessive sweating of the underarms, chest, back or legs and improve your quality of life.

Symptoms

Consider SDLA® if you experience any of these symptoms:

- Excessive underarm sweating / malodor.
- Excessive sweating on the chest, under breasts, abdomen, back, legs, or thighs.
- Compensatory sweating after a sympathectomy.

Bromhidrosis (also spelled Bromhidrosis) is malodorous sweat that may occur in the axilla and feet. In most cases it is associated with:

- Hyperhidrosis.
- Apocrine glands dysfunction.
- Bacterial and fungal infections.
- Fatty acids decomposition producing distinctive odor.

- Certain foods such as garlic, onion and excessive protein ingestion.
- Heavy metals: arsenic.

Call today to schedule a free phone consultation with Dr. Nielson so he can explain what SDLA® can do for you.
